

# Formula Sheet

**Population mean formula.**  $\mu = \frac{\sum x_i}{N}$  where the summation is taken over all data points in the population, and  $N$  is the population size.

**Population variance formula.**  $\sigma^2 = \frac{\sum (x_i - \mu)^2}{N}$  where the summation is taken over all data points in the population, and  $N$  is the population size.

**Population standard deviation formula.**  $\sigma = \sqrt{\sigma^2}$ .

**Sample mean formula.**  $\bar{x} = \frac{\sum_{i=1}^n x_i}{n}$ , where  $n$  is the sample size.

**Sample variance formula.**  $s^2 = \frac{\sum_{i=1}^n (x_i - \bar{x})^2}{n - 1}$ , where  $n$  is the sample size.

**Sample standard deviation formula.**  $s = \sqrt{s^2}$ .

---

## Normal distribution/Bell curve

$$f(x) = \frac{1}{\sigma\sqrt{2\pi}} \exp(-1/2[(x - \mu)/\sigma]^2)$$

## Change of Variable formulas.

Given a normal variable  $x$  with a mean  $\mu$  and a standard deviation  $\sigma$ , we may convert it to a standard normal variable  $z$  by the formula

$$z = \frac{x - \mu}{\sigma}$$

Then,

$$P\left(\frac{x - \mu}{\sigma} \leq a\right) = P(x \leq a\sigma + \mu)$$

$$P\left(\frac{x - \mu}{\sigma} \geq a\right) = P(x \geq a\sigma + \mu)$$

for any number  $a$ .

$$P(x \leq a) = P\left(z \leq \frac{a - \mu}{\sigma}\right)$$

$$P(x \geq a) = P\left(z \geq \frac{a - \mu}{\sigma}\right)$$

for any number  $a$ .

---

$z_\alpha$  formulas.

- $P(z \geq z_\alpha) = \alpha$ .
- For any  $0 \leq \alpha \leq 1$  we have  $-z_\alpha = z_{1-\alpha}$ .

### Sampling distribution (Ch.8) formulas.

Fix a population and a sample size  $n$ . Assume all samplings are random.

Theorem	need $n < 0.05N$ ?
1 $\mu_{\bar{x}} = \mu$ ( $\mu$ is the mean of the original population)	NO
2 $\sigma_{\bar{x}} = \sigma/\sqrt{n}$ ( $\sigma$ is the standard deviation of the original population)	YES
3 $x$ being approximately normal implies $\bar{x}$ is approximately normal	NO
4 CLT: $n \geq 30$ implies $\bar{x}$ is approximately normal	YES
5 $\mu_{\hat{p}} = p$	NO
6 $\sigma_{\hat{p}} = \sqrt{\frac{p(1-p)}{n}}$	YES
7 $np(1-p) \geq 10$ implies $\hat{p}$ is approximately normal	YES

### Confidence Interval (Ch.9) formulas.

Interval estimator for population proportion, margin of error formula to a level of confidence  $(1 - \alpha)100\%$ .

We use  $n\hat{p}(1 - \hat{p}) \geq 10$ , where  $\hat{p}$  is the sample proportion of our particular sample, to determine if the variable  $\hat{p}$  is approximately normally distributed.

If  $\hat{p}$  is approximately normally distributed, we can use

$$E = z_{\alpha/2} \sqrt{\frac{\hat{p}(1 - \hat{p})}{n}}$$

to construct an interval estimator of  $p$ .

Determine sample size needed, given  $\alpha$  and an error  $E'$ .

1. **Method 1.**

$$n = \tilde{p}(1 - \tilde{p}) \left( \frac{z_{\alpha/2}}{E'} \right)^2$$

rounded up to the next integer, where  $\tilde{p}$  is a **prior point estimator** of  $p$ .

2. **Method 2.** If we do not have a prior point estimator information,

$$n = 0.25 \left( \frac{z_{\alpha/2}}{E'} \right)^2$$

rounded up to the next integer.

**Interval estimator for population mean, margin of error formula to a level of confidence  $(1 - \alpha)100\%$ .**

If the variable

$$t = \frac{\bar{x} - \mu}{s/\sqrt{n}}$$

has a distribution that can be approximated by the Student's  $t$ -distribution, we may use

$$E = t_{\alpha/2} \frac{s}{\sqrt{n}}$$

(where  $t_{\alpha/2}$  is with  $n - 1$  degrees of freedom) to construct a confidence interval of confidence level  $(1 - \alpha)100\%$  of  $\mu$  by  $[\bar{x} - E, \bar{x} + E]$ .

**Hypothesis test for a population proportion.**

		Reality	
		$H_0$ Is True	$H_1$ Is True
Conclusion	Do Not Reject $H_0$	Correct Conclusion	Type II Error
	Reject $H_0$	Type I Error	Correct Conclusion

Test statistic formula

$$z_0 = \frac{\hat{p} - \mu_{\hat{p}}}{\sigma_{\hat{p}}},$$

where  $\hat{p}$  is the sample mean of the particular sample obtained.

	Two-Tailed	Left-Tailed	Right-Tailed
