

Formula Sheet

Population mean formula. $\mu = \frac{\sum x_i}{N}$ where the summation is taken over all data points in the population, and N is the population size.

Population variance formula. $\sigma^2 = \frac{\sum (x_i - \mu)^2}{N}$ where the summation is taken over all data points in the population, and N is the population size.

Population standard deviation formula. $\sigma = \sqrt{\sigma^2}$.

Sample mean formula. $\bar{x} = \frac{\sum_{i=1}^n x_i}{n}$, where n is the sample size.

Sample variance formula. $s^2 = \frac{\sum_{i=1}^n (x_i - \bar{x})^2}{n - 1}$, where n is the sample size.

Sample standard deviation formula. $s = \sqrt{s^2}$.

Normal distribution/Bell curve

$$f(x) = \frac{1}{\sigma\sqrt{2\pi}} \exp(-1/2[(x - \mu)/\sigma]^2)$$

z_α formulas.

- $P(z \geq z_\alpha) = \alpha$.
- For any $0 \leq \alpha \leq 1$ we have $-z_\alpha = z_{1-\alpha}$.

Hypothesis test for a population mean, change of variable to t .

$$t = \frac{\bar{x} - \mu}{s/\sqrt{n}}.$$

If x is approximately a normal variable, or if $n > 30$, this variable t follows Student's t -distribution with $df = n - 1$.

Hypothesis test for two population proportions, independent samples.

If $n\hat{p}_1(1 - \hat{p}_1) \geq 10$ and $n\hat{p}_2(1 - \hat{p}_2) \geq 10$, then the variable $\hat{p}_1 - \hat{p}_2$ has an approximately normal distribution. We may convert $\hat{p}_1 - \hat{p}_2$ to a standard normal variable via

$$z = \frac{\hat{p}_1 - \hat{p}_2 - (p_1 - p_2)}{\sqrt{\hat{p}(1 - \hat{p})} \sqrt{\frac{1}{n_1} + \frac{1}{n_2}}},$$

where $\hat{p} = \frac{x_1 + x_2}{n_1 + n_2}$.

Hypothesis test for two population means, matched pair data.

$$d_i = x_i - y_i$$

If d is approximately normally distributed, or if $n > 30$, then the new variable

$$t = \frac{\bar{d} - \mu_d}{s_d / \sqrt{n}}$$

follows Student's t -distribution with $df = n - 1$.

Hypothesis test for two population means, independent samples.

If the two populations are both normally distributed, or if both n_1 and n_2 are > 30 , then the new variable

$$t = \frac{(\bar{x}_1 - \bar{x}_2) - (\mu_1 - \mu_2)}{\sqrt{\frac{s_1^2}{n_1} + \frac{s_2^2}{n_2}}}$$

approximately follows Student's t -distribution with the smaller of $n_1 - 1$ or $n_2 - 1$ degrees of freedom.

Sample linear correlation coefficient

$$r = \frac{\sum_i \left(\frac{(x_i - \bar{x})}{s_x} \frac{(y_i - \bar{y})}{s_y} \right)}{n - 1} = \frac{\sum_i (x_i - \bar{x})(y_i - \bar{y})}{s_x s_y (n - 1)}$$

Least squares regression line of a sample

$$b_1 = r \cdot \frac{s_y}{s_x}$$

$$b_0 = \bar{y} - b_1 \bar{x}$$

$$\hat{y} = b_0 + b_1 x$$

Inference about β_1

$$s_e = \sqrt{\frac{\sum_i (y_i - \hat{y}_i)^2}{n - 2}} = \sqrt{\frac{\sum_i \text{residuals}^2}{n - 2}}$$

where $\sum_i \text{residuals}^2$ is the sum of square residuals of a least squares regression line.

$$s_{b_1} = \frac{s_e}{s_x \sqrt{n - 1}}$$

Change of variable in a hypothesis test about β_1

$$t = \frac{b_1 - \beta_1}{s_{b_1}}$$

follows Student's t -distribution with $n - 2$ degrees of freedom if the residual plot of the sample has no obvious pattern and the distribution of the error ϵ is assumed to be normal.
