# Formula Sheet

**Population mean formula.**  $\mu = \frac{\sum x_i}{N}$  where the summation is taken over all data points in the population, and N is the population size.

Population variance formula.  $\sigma^2 = \frac{\sum (x_i - \mu)^2}{N}$  where the summation is taken over all data points in the population, and N is the population size.

Population standard deviation formula.  $\sigma = \sqrt{\sigma^2}$ .

Sample mean formula.  $\overline{x} = \frac{\sum_{i=1}^{n} x_i}{n}$ , where n is the sample size.

Sample variance formula.  $s^2 = \frac{\sum_{i=1}^n (x_i - \overline{x})^2}{n-1}$ , where n is the sample size.

Sample standard deviation formula.  $s = \sqrt{s^2}$ .

## Normal distrubution/Bell curve

$$f(x) = \frac{1}{\sigma\sqrt{2\pi}} \exp(-1/2[(x-\mu)/\sigma]^2)$$

### Change of Variable formulas.

Given a normal variable x with a mean  $\mu$  and a standard deviation  $\sigma$ , we may convert it to a standard normal variable z by the formula

$$z = \frac{x - \mu}{\sigma}$$

Then,

$$P(\frac{x-\mu}{\sigma} \le a) = P(x \le a\sigma + \mu)$$

$$P(\frac{x-\mu}{\sigma} \ge a) = P(x \ge a\sigma + \mu)$$

for any number a.

$$P(x \le a) = P(z \le \frac{a - \mu}{\sigma})$$

$$P(x \ge a) = P(z \ge \frac{a - \mu}{\sigma})$$

for any number a.

## $z_{\alpha}$ formulas.

- $P(z \ge z_{\alpha}) = \alpha$ .
- For any  $0 \le \alpha \le 1$  we have  $-z_{\alpha} = z_{1-\alpha}$ .

### Sampling distribution (Ch.8) formulas.

Fix a population and a sample size n. Assume all samplings are random.

| Theorem |  | need $n < 0.05N$ ? |
|---------|--|--------------------|
| 1       | $\mu_{\overline{x}} = \mu \ (\mu \text{ is the mean of the original population})$                          | NO                 |
| 2       | $\sigma_{\overline{x}} = \sigma/\sqrt{n}$ ( $\sigma$ is the standard deviation of the original population) | YES                |
| 3       | $x$ being approximately normal implies $\overline{x}$ is approximately normal                              | NO                 |
| 4       | CLT: $n \ge 30$ implies $\overline{x}$ is approximately normal   | YES                |
| 5       | $\mu_{\hat{p}} = p$  | NO                 |

| 7       | $np(1-p) \ge 10$ implies $\hat{p}$ is approximately normal   | YES                |

# Confidence Interval (Ch.9) formulas.

Interval estimator for population proportion, margin of error formula to a level of confidence  $(1 - \alpha)100\%$ .

We use  $n\hat{p}(1-\hat{p}) \geq 10$ , where  $\hat{p}$  is the sample proportion of our particular sample, to determine if the variable  $\hat{p}$  is approximately normally distributed.

If  $\hat{p}$  is approximately normally distributed, we can use

$$E = z_{\alpha/2} \sqrt{\frac{\hat{p}(1-\hat{p})}{n}}$$

to construct an interval estimator of p.

Determine sample size needed, given  $\alpha$  and an error E'.

#### 1. Method 1.

$$n = \tilde{p}(1 - \tilde{p}) \left(\frac{z_{\alpha/2}}{E'}\right)^2$$

rounded up to the next integer, where  $\tilde{p}$  is a **prior point estimator** of p.

2. **Method 2.** If we do not have a prior point estimator information,

$$n = 0.25 \left(\frac{z_{\alpha/2}}{E'}\right)^2$$

rounded up to the next integer.

Interval estimator for population mean, margin of error formula to a level of confidence  $(1-\alpha)100\%$ .

If the variable

$$t = \frac{\overline{x} - \mu}{s / \sqrt{n}}$$

has a distribution that can be approximated by the Student's t-distribution, we may use

$$E = t_{\alpha/2} \frac{s}{\sqrt{n}}$$

(where  $t_{\alpha/2}$  is with n-1 degrees of freedom) to construct a confidence interval of confidence level  $(1-\alpha)100\%$  of  $\mu$  by  $[\overline{x}-E, \overline{x}+E]$ .

Hypothesis test for a population proportion.

|            |                                 | Reality                |                       |  |  |  |  |
|------------|---------------------------------|------------------------|-----------------------|--|--|--|--|
|            |                                 | H <sub>0</sub> Is True | H₁ Is True            |  |  |  |  |
| Conclusion | Do Not<br>Reject H <sub>0</sub> | Correct<br>Conclusion  | Type II Error         |  |  |  |  |
|            | Reject H <sub>0</sub>           | Type I Error           | Correct<br>Conclusion |  |  |  |  |

Test statistic formula

$$z_0 = \frac{\hat{p} - \mu_{\hat{p}}}{\sigma_{\hat{p}}},$$

where  $\hat{p}$  is the sample mean of the particular sample obtained. This formula can only be used if the variable  $\hat{p}$  is normal.

Hypothesis test for a population mean, change of variable to t.

$$t = \frac{\overline{x} - \mu}{s / \sqrt{n}}.$$

If x is approximately a normal variable, or if n > 30, this variable t follows Student's t-distribution with df = n - 1.

Hypothesis test for two population proportions, independent samples.

If  $n\hat{p}_1(1-\hat{p}_1) \geq 10$  and  $n\hat{p}_2(1-\hat{p}_2) \geq 10$ , then the variable  $\hat{p}_1 - \hat{p}_2$  has an approximately normal distribution. We may convert  $\hat{p}_1 - \hat{p}_2$  to a standard normal variable via

$$z = \frac{\hat{p}_1 - \hat{p}_2 - (p_1 - p_2)}{\sqrt{\hat{p}(1-\hat{p})}\sqrt{\frac{1}{n_1} + \frac{1}{n_2}}},$$

where 
$$\hat{p} = \frac{x_1 + x_2}{n_1 + n_2}$$
.

Hypothesis test for two population means, matched pair data.

$$d_i = x_i - y_i$$

If d is approximately normally distributed, or if n > 30, then the new variable

$$t = \frac{\overline{d} - \mu_d}{s_d / \sqrt{n}}$$

follows Student's t-distribution with df = n - 1.

### Hypothesis test for two population means, independent samples.

If the two populations are both normally distributed, or if both  $n_1$  and  $n_2$  are > 30, then the new variable

$$t = \frac{(\overline{x}_1 - \overline{x}_2) - (\mu_1 - \mu_2)}{\sqrt{\frac{s_1^2}{n_1} + \frac{s_2^2}{n_2}}}$$

approximately follows Student's t-distribution with the smaller of  $n_1 - 1$  or  $n_2 - 1$  degrees of freedom.

#### Sample linear correlation coefficient

$$r = \frac{\sum_{i} \left( \frac{(x_i - \overline{x})}{s_x} \frac{(y_i - \overline{y})}{s_y} \right)}{n - 1} = \frac{\sum_{i} (x_i - \overline{x})(y_i - \overline{y})}{s_x s_y (n - 1)}$$

#### Least squares regression line of a sample

$$b_1 = r \cdot \frac{s_y}{s_x}$$
$$b_0 = \overline{y} - b_1 \overline{x}$$
$$\hat{y} = b_0 + b_1 x$$

## Inference about $\beta_1$

$$s_e = \sqrt{\frac{\sum_i (y_i - \hat{y}_i)^2}{n-2}} = \sqrt{\frac{\sum_i \text{residuals}^2}{n-2}}$$

where  $\sum_{i}$  residuals<sup>2</sup> is the sum of square resuduals of a least squares regression line.

$$s_{b_1} = \frac{s_e}{s_x \sqrt{n-1}}$$

# Change of variable in a hypothesis test about $\beta_1$

$$t = \frac{b_1 - \beta_1}{s_{b_1}}$$

follows Student's t-distribution with n-2 degrees of freedom if the residual plot of the sample has no obvious pattern and the distribution of the error  $\epsilon$  is assumed to be normal.

### Convert a categorical variable to dummy variables

Suppose u is a catagorical variable of k levels: **Level 1** to **Level k**. Picking **Level 1** to be the base level allows the following dummy variables to be defined:

$$x_1 = \begin{cases} 1, & \text{if } u \text{ is at Level 2} \\ 0, & \text{otherwise} \end{cases} \qquad x_2 = \begin{cases} 1, & \text{if } u \text{ is at Level 3} \\ 0, & \text{otherwise} \end{cases} \qquad \cdots \qquad x_{k-1} = \begin{cases} 1, & \text{if } u \text{ is at Level } k \\ 0, & \text{otherwise} \end{cases}$$

Given a least squares prediction equation of a sample whose data points are of the form  $(x_1, x_2, ..., x_{k-1}, y)$ , where  $x_i$  are dummy variables of a categorical variable u of k levels, and y is a quantitative response variable. The lease squares prediction equation of this sample

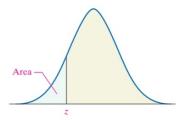

$$\hat{y} = b_0 + b_1 x_1 + \dots + b_{k-1} x_{k-1}$$

is given by the following formulas.

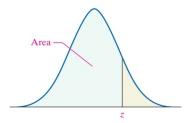

$$b_0 = \overline{y}_1$$

$$b_i = \overline{y}_{i+1} - \overline{y}_1,$$

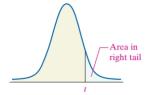

for any  $1 \le i \le k-1$ , where  $\overline{y}_i$  is the mean value of the response variable y when u is at **Level** i.
